

YOUR FIRST PRACTICAL USE OF AI

A bot that reads your notes.

*Today we use AI to get ourselves organized — and
learn the loop behind everything else in this course.*

“AI” is not one thing. *It's a toolbox.*

Chatbots, image generators, code assistants, search agents — different tools for different jobs. This course will hand you several of them.

Image generator

Code assistant

Search agent

Chatbot

Knowledge assistant ←

...and more

We start with the most practical tool of all: one that reads your material and answers questions about it. First job — get organized.

A *study buddy* that has read your notes — and won't bluff.

A Claude Project is just those two parts: *knowledge* and *instructions*. The files are easy. The instructions are the skill.

Before you write a word, answer *three questions*.

QUESTION 1

What role does Claude play?

Who are you?

QUESTION 2

Who is being helped — and what do they already know?

Who am I?

QUESTION 3

What's the goal — and what should Claude not do?

What will we do together?

Three short paragraphs. That's the whole prompt.

WHO ARE YOU?

You are a study assistant for CSC-113. You explain concepts clearly and patiently using the material I give you.

WHO AM I?

I'm a student who attended the lectures. I know the basics but get stuck on details. Use plain language. Don't assume I'm an expert.

WHAT TOGETHER?

We clarify confusing topics by Q&A. Use *only* my uploaded notes. If something isn't covered, say so. Never make up an answer.

One rule does the heavy lifting: *"use only my notes."*

X WITHOUT THE RULE

You ask about something your notes never mention...

"The exam is worth 30% of your grade."

(It made that up. It sounds right. It's wrong.)

✓ WITH THE RULE

Same question, same missing info...

"That isn't in the notes you gave me."

*That rule gives the AI **permission to say "I don't know."** It's the line between a tool you can trust and one that confidently misleads you.*

Test it three ways.

● KNOWN GOOD

Ask something your notes clearly answer.

Does it give the right answer, from your material?

should SUCCEED

● KNOWN BAD

Ask something your notes don't cover at all.

Does it admit it doesn't know — or bluff?

should be REFUSED

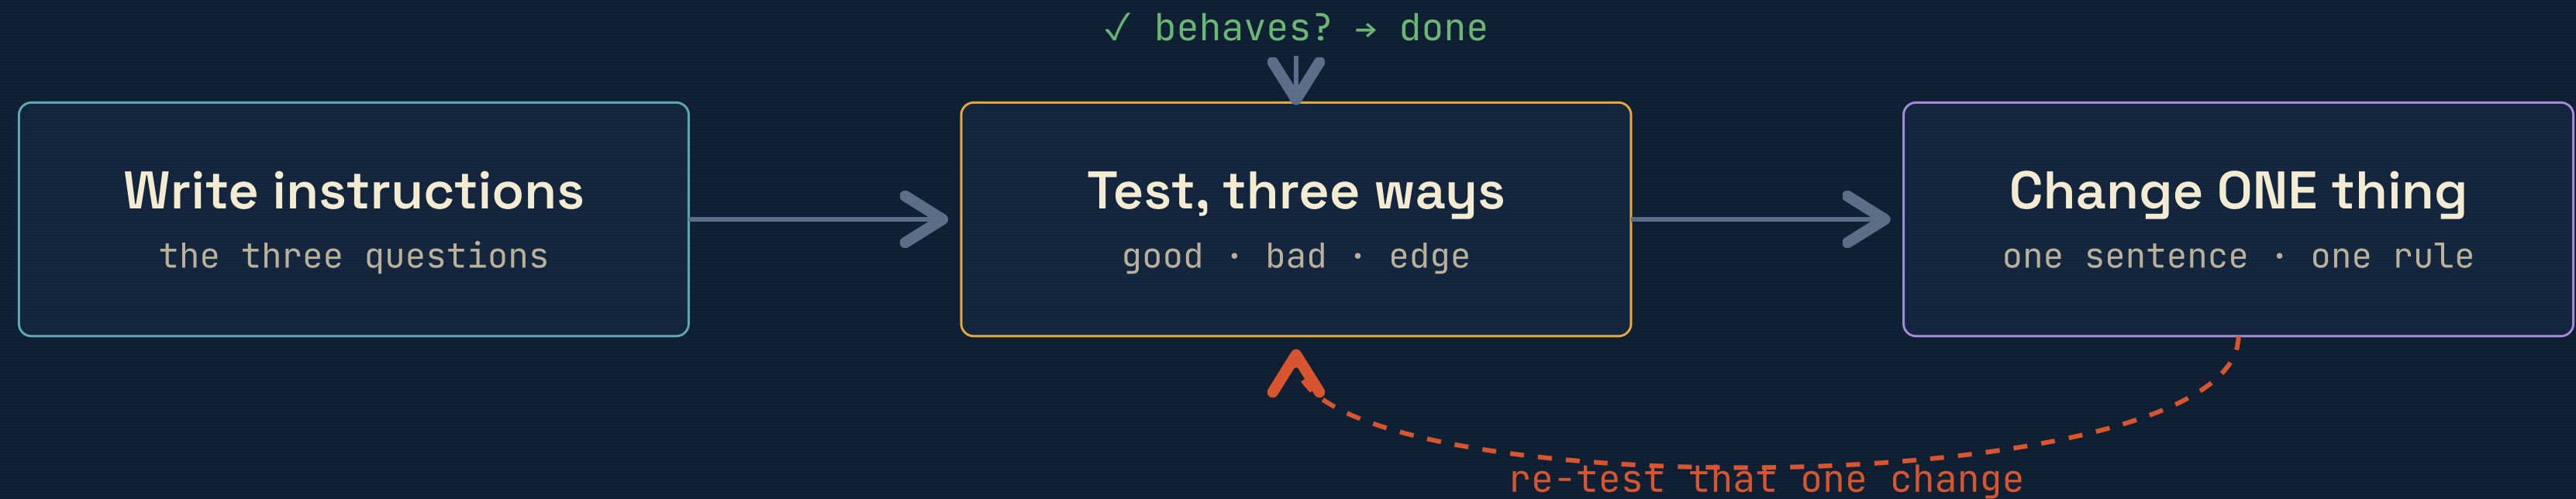

● EDGE CASE

Ask something in the gray area — partly covered.

What does it do at the boundary of what it knows?

for DISCOVERY

When something's off, change *one thing*.

Change five things at once and you won't know which one fixed it. *One change, one re-test, one observation.* (Yes — the same rule from CSC-113.)

Your lab, start to finish.

- 1** **Gather your notes** — two or three files you'd actually study from.
- 2** **Create the Project** on [claude.ai](#).
- 3** **Write instructions** — answer the three questions.
- 4** **Add your knowledge** — upload the files.
- 5** **Run three tests** — good, bad, edge.
- 6** **Make one change** — then re-test it.
- 7** **Commit to GitHub** — into your `module1` folder.

Everything for this module lives in `module1/`

`module1/`

- └─ `custom-instructions.md` # your 3 paragraphs
- └─ `testing-log.md` # 3 tests + 1 change
- └─ `notes/` # the files you uploaded

CODE BUILDERS

Your normal Git workflow — add, commit, push into `module1/`.

PROMPT MASTERS

GitHub web or GitHub Desktop — **drag and drop** your files into `module1/`.

Before you leave.

- ☐ My Project exists, with instructions written and notes uploaded.
- ☐ My instructions answer all three questions *and* include the "use only my notes" rule.
- ☐ I ran all three tests and wrote down what happened.
- ☐ I made one change and re-tested it.
- ☐ It's all committed under `module1/`.

You just learned how to build a bot.

NEXT MEETING

Build the one that matters — your *csc114bot*: a Project that helps you navigate *this course*. Same skills. Real purpose.

→ This lab was the rehearsal. *Now we build for keeps.*
